ABSTRACT

This article analyzes the progression of reading-comprehension skills in Increasing Reading Power 3, a ten-module educational material for young readers. The modules move from noting details, sequencing events, identifying the main idea, recognizing cause-and-effect relationships, and predicting outcomes to drawing conclusions, making inferences, comparing and contrasting, distinguishing fact from opinion, and identifying fantasy and reality. The analysis interprets this sequence as a gradual movement from literal retrieval toward organization, relational reasoning, inference, and early evaluative reading. Across the modules, skill explanations are followed by vocabulary preparation, a short text, reflection, guided practice, a second application task, and a productive writing or drawing activity. The article proposes a five-band progression model and discusses how the sequence can support cumulative comprehension instruction when teachers make the connections among skills explicit.

Keywords: reading comprehension, Grade 3, skill progression, literal comprehension, inference, critical literacy, modular instruction

INTRODUCTION

Reading comprehension develops through more than remembering isolated facts. Young readers must first locate information, then organize it, connect ideas, infer meanings that are not directly stated, and eventually judge the status of statements and events. The source book organizes these demands into ten separate modules, each centered on one named comprehension skill.

The present analysis treats the ten-module sequence as an instructional architecture rather than as ten unrelated lessons. The goal is to identify how the demands placed on the learner change from the beginning to the end of the book and how those changes may create a progression from literal to increasingly interpretive reading.

The Ten-Module Sequence

Module Skill focus Primary reader operation

Noting Details Locate important and specific information; answer who, what, where, when, and how questions.

Sequencing Events Arrange happenings in order using temporal clues and story chronology.

Getting the Main Idea Identify what a passage is mostly about and connect supporting details to the central idea.

Identifying Cause and Effect Relate why something happens to what happens as a result.

Predicting Outcomes Use prior knowledge, story clues, and picture clues to anticipate what may happen next.

Drawing Conclusions Combine details, facts, and prior knowledge to reach a reasonable decision.

Making Inferences Connect text facts with background knowledge and derive a logical unstated meaning.

Comparing and Contrasting Identify similarities and differences and organize them visually.

Distinguishing Fact from Opinion Judge whether a statement can be verified or expresses ideas or feelings.

Identifying Fantasy and Reality Judge whether a statement or event could occur in real life.

Five Bands of Comprehension Demand

Band Modules Instructional emphasis

Literal retrieval 1 Finding explicit details that make the text understandable.

Text organization 2-4 Ordering events, locating central ideas, and linking causes with effects.

Anticipation and inference 5-7 Moving beyond what is directly stated by predicting, concluding, and inferring.

Relational analysis 8 Holding two subjects or settings in mind and organizing similarities and differences.

Early evaluative reading 9-10 Classifying statements according to verifiability and events according to real-world possibility.

The first modules rely heavily on information that can be pointed to in the text. As the book progresses, the learner is increasingly required to combine information, use background knowledge, or classify the status of statements. Module 5 is a useful transition: prediction still depends on textual clues, but the answer is not yet fully present in the passage.

Five journal-style articles derived from Serdeña (2021)
Page 3

Modules 6 and 7 deepen that transition by requiring learners to reach meanings that emerge from details rather than from a single sentence. Module 8 then asks learners to organize relationships across two entities, while Modules 9 and 10 introduce elementary evaluative judgments about evidence and plausibility.

Cumulative Skill Relationships

Although each module is presented as a distinct lesson, several skills depend on earlier ones. Drawing conclusions and making inferences require readers to notice details accurately. Predicting outcomes depends on identifying relevant clues and causal relationships. Comparing and contrasting requires readers to select details from more than one subject. Distinguishing fact from opinion also depends on careful attention to wording and evidence.

For this reason, the strongest use of the book is cumulative. Teachers can remind learners that later skills reuse earlier ones. A student who struggles with inference, for example, may need support not only in inference itself but also in locating the facts from which the inference should be drawn.

A Recurrent Learning Cycle

The book repeatedly uses a recognizable pattern: state objectives, explain the target skill, prepare selected vocabulary through 'Tricky words,' present a story or selection, ask the learner to reflect, provide a first practice activity, provide a second 'Think & Practice' task, and end with a 'Proofread & Write' or similar productive activity. Answer keys and performance descriptions are frequently provided.

This recurring structure can reduce procedural uncertainty. Because the learner knows what kind of sequence to expect, attention can be directed toward the changing comprehension skill rather than toward learning a new worksheet format in every module.

Implications for Instruction

The ten-module progression can be strengthened by explicitly naming connections across lessons. Before teaching inference, for example, the teacher can review noting details and drawing conclusions. Before fact and opinion, the teacher can revisit how supporting details are located and how evidence is checked. Such cross-module bridges would make the progression visible to learners rather than leaving it implicit.

The sequence also suggests a useful assessment principle: later modules should not be interpreted as measuring only one isolated skill. They increasingly

depend on multiple earlier competencies. A learner's error in a fact-opinion activity may reflect vocabulary, detail recognition, or difficulty understanding the statement rather than only failure to understand the fact-opinion distinction.

LIMITATIONS

This article is an analysis of the printed instructional design. The source does not provide pretest-posttest data, classroom comparison groups, or longitudinal evidence showing that the ten-module sequence causes improved reading achievement. The progression described here is therefore a pedagogical interpretation of the material's organization, not an effectiveness claim.

CONCLUSION

Increasing Reading Power 3 presents a coherent movement from explicit information toward increasingly interpretive and evaluative reading. Its ten modules can be understood as a cumulative pathway: readers first notice and organize what the text says, then infer what it implies, compare ideas, and finally judge statements and events. Making those relationships explicit can help transform the book from a collection of exercises into a structured comprehension program.
